What does 15/20A mean when it comes to the power of the sauna?

New for 2022 we have specifically designed our Signature 2 and Signature 2 corner saunas to be able to run on either a standard 15 amp or 20 amp breaker. This design change allows those who have the capability to upgrade their power supply to a 20 amp service to do so without needing a complete new model.

This means that we prefabricated and pre-installed 2 additional heaters in each model to allow for a quicker heat time in low temperature areas (basements, garages etc.). The changes are subtle and those who wish to run the sauna on a standard 15amp will have no issues. The additional heaters can be left disconnected and will be ready and waiting for future use if desired.

We understand that upgrading to a 20amp service is not always practical and instead of carrying multiple models that were almost identical we specifically designed our new models to be 15 or 20 amp friendly!

Both models come with an in depth owners manual which contains detailed installation instructions. We also include a special guide with reference images to aid in the installation process. No matter which power supply you decide to use the installation and control of the sauna will be easy and straightforward.

Sincerely,
Management
Blackstone Saunas
